Homework 4

Qianlang Chen

Problem 1

According to the properties of probability mass functions, the total probability of all possible cases combined should equal to 1. We can form the following equation using this feature:

$$\sum_{i=1}^4 p_i = 1$$

$$\sum_{i=1}^4 \alpha \cdot (i+1) = 1$$

$$\alpha \cdot (1+1) + \alpha \cdot (2+1) + \alpha \cdot (3+1) + \alpha \cdot (4+1) = 1$$

$$14\alpha = 1$$

$$\alpha = \boxed{\frac{1}{14}}$$

First, let us find the probability density function of X:

$$f(x) = \begin{cases} 0, & x < 0 \text{ or } x > 2\\ \frac{1}{b-a} = \frac{1}{2-0} = \frac{1}{2}, & 0 \le x \le 2 \end{cases}$$

According to the Change-of-variable formula, we have

$$\mathbb{E}(g(X)) = \int_{-\infty}^{\infty} g(x) \ f(x) \ dx$$

$$= \int_{-\infty}^{0} (x^3 + x^2) \cdot 0 \ dx + \int_{0}^{2} (x^3 + x^2) \cdot \frac{1}{2} \ dx + \int_{2}^{\infty} (x^3 + x^2) \cdot 0 \ dx$$

$$= 0 + \frac{10}{3} + 0$$

$$= \boxed{\frac{10}{3}}$$

Part (a)

$$P(X = k) = \begin{cases} 0, & k \le 0\\ (1 - \frac{1}{2})^{k-1} \cdot (\frac{1}{2})^1 = \frac{1}{2^k}, & k > 0 \end{cases}$$

Part (b)

$$\mathbb{E}(X) = \sum_{k} k \cdot P(X = k)$$

$$= \sum_{k=1}^{\infty} k \cdot \frac{1}{2^k}$$

$$= \frac{1}{2} + \frac{2}{4} + \frac{3}{8} + \cdots$$

$$= \boxed{2}$$

Probability Density Functions

PDF of X:

$$f(x) = \begin{cases} 0, & x < -1 \text{ or } x > 1\\ \frac{1}{b-a} = \frac{1}{1-(-1)} = \frac{1}{2}, & -1 \le x \le 1 \end{cases}$$

PDF of Y:

$$f(y) = \begin{cases} 0, & y < -4 \text{ or } y > 4\\ \frac{1}{b-a} = \frac{1}{4-(-4)} = \frac{1}{8}, & -4 \le y \le 4 \end{cases}$$

PDF of Z:

$$f(z) = \begin{cases} 0, & z < 4 \text{ or } z > 6\\ \frac{1}{b-a} = \frac{1}{6-4} = \frac{1}{2}, & 4 \le z \le 6 \end{cases}$$

Expected Values

Expected Value of X:

$$\mathbb{E}(X) = \int_{-\infty}^{\infty} x \cdot f(x) \, dx = \int_{-1}^{1} x \cdot \frac{1}{2} \, dx = 0$$

Expected Value of Y:

$$\mathbb{E}(Y) = \int_{-\infty}^{\infty} y \cdot f(y) \, dy = \int_{-4}^{4} y \cdot \frac{1}{8} \, dy = 0$$

Expected Value of Z:

$$\mathbb{E}(Z) = \int_{-\infty}^{\infty} z \cdot f(z) \, dz = \int_{4}^{6} z \cdot \frac{1}{2} \, dz = 5$$

Variances

Let us use the shortcut formula described in the textbook:

$$Var(X) = \mathbb{E}(X^2) - \mathbb{E}^2(X)$$

Variance of X:

$$Var(X) = \mathbb{E}(X^2) - \mathbb{E}^2(X)$$

$$= \int_{-1}^1 x^2 \cdot \frac{1}{2} dx - 0^2$$

$$= \frac{1}{3} - 0$$

$$= \boxed{\frac{1}{3}}$$

Variance of Y:

$$Var(Y) = \mathbb{E}(Y^2) - \mathbb{E}^2(Y)$$

$$= \int_{-4}^4 y^2 \cdot \frac{1}{8} dy - 0^2$$

$$= \frac{16}{3} - 0$$

$$= \left[\frac{16}{3}\right]$$

Variance of Z:

$$Var(Z) = \mathbb{E}(Z^2) - \mathbb{E}^2(Z)$$

$$= \int_4^6 z^2 \cdot \frac{1}{2} dz - 5^2$$

$$= \frac{76}{3} - 25$$

$$= \boxed{\frac{1}{3}}$$

Observations

The variances of X and Z are the same because their random variables come from regions with the same size (2) and are both uniform.

Part (a)

Part (b)
